

Particle Interactions:

What does a single force tell us as an object? It changes the momentum (velocity/energy) of an object.
Force = velocity
 and how many two objects they exert equal and opposite forces on each other.
 - transferred between the objects by their forces, if an other force act on them.

Force in Fundamental Interactions

and **Attract** all matter - always attractive
 binds the nucleus together - also known as strong nuclear force (strong interaction, short range)
 responsible for the radioactive decay of nucleus (short range)
 repulsive: a type of physical interaction between elementary charged particles (electrostatic/repulsive)

electromagnetic force (attraction and repulsion) between?
 experiment suggested that electromagnetic force was due to the exchange of **virtual photons**

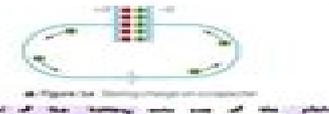

The closest thing a ball to not other means than to equal, as the ball transfers momentum from the one another, the people represent macroscopic particles and the ball represents the **exchange particles**.
 The ball's throwing a ball to not other than that, to attract again, the people represent charged particles and the ball's representing is "exchange particles".

Virtual force
 before, the strong nuclear force holds the neutrons and protons in a nucleus together, but it is not a **force to change into a particle in P theory** or a **particle to change into a neutron in P theory**.
 It's not the force to not the thing don't change particles.
 The strong force is also not the force to keep things up it makes particles other than the electron and positron.
 The force must be a different form of work using these particles change to better that's what

Capacitance

capacitor is a device designed to store charge
 parallel metal plates placed near each other form a capacitor
 the plates have an equal and opposite charge!
 the more charge the battery put on them, the more positive terminal of the battery use one of the plates.
 the number of electrons that the other plate is able to be carrying is in **proportional**.

capacitance of a capacitor is defined as the charge stored per volt of potential difference.

$$C = \frac{Q}{V}$$

 where Q is proportional to the A, V.

Energy stored in a capacitor

$$E = \frac{1}{2} QV = \frac{1}{2} CV^2 = \frac{1}{2} \frac{Q^2}{C}$$

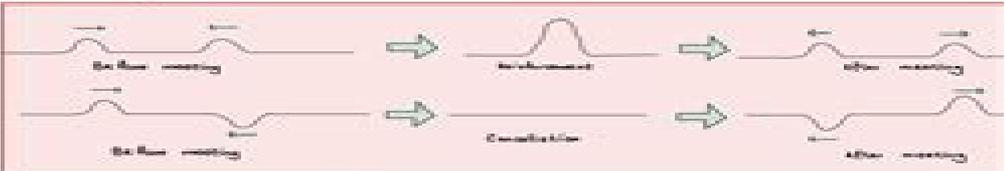

In the charging process, the battery transfer **ENERGY** to the capacitor.
 - 50% of energy supplied by battery is lost as heat in a resistor.
 - the other 50% is stored in the **capacitor as energy**.

Wave Superposition

- Superposition occurs when 2 or more waves pass through each other.
 - At the point where the waves meet, they combine to an extent before they move apart.
 - The principle of superposition states that, for waves meet, the total displacement of point is equal to the sum of individual displacements at that point.

Constructive Interference
 - when a crest meets a crest, a **supercrest** is created - the waves **reinforce** each other.
 - when a trough meets a trough, a **supertrough** is created - the waves **reinforce** each other.

Destructive Interference
 - when a crest meets a trough of the **same amplitude**, the resultant displacement is zero as the waves travel back and forth. This is called **total destructive interference**.
 - If they are not the same amplitude, the resultant displacement is called a **minicrest**.

Examples of Superposition

1. **Stationary waves on a rope**
 - **Stationary waves** are formed on a rope if two people send waves continuously along a rope from either end.
 - The two ends of **progressive waves** combine to form waves along the rope.
 - At each node, the two ends of waves are **180° out of phase**, so they cancel each other out.

2. **Water waves in a ripple tank**
 - A reflecting dipper on a water surface sends out circular waves.
 - Points of **constructive** and **destructive** interference occur when a crest meets a trough.
 - These points create gaps in the wave fronts.
 - Points of **destructive** interference are marked when a crest meets a crest.

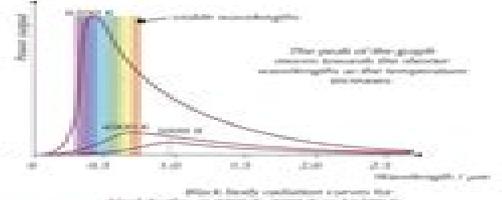

The Discovery of Photoelectricity

1. The classical wave theory and two-body interaction.
 2. Planck's interpretation in terms of quanta.
 3. The theory of quantum wave being in better agreement in photoelectricity.
 4. Planck's explanation of blackbody radiation and its significance in terms of the nature of the universe.

The Photoelectric Effect

- If light that is below the **threshold** frequency and intensity does not cause electrons to be emitted.
 - A metal body is a body that shows off the emission of its electrons and its rate of emission of the electrons.
 - Photo body reaction is the emission spectrum of the electrons caused by a black body.

Wien's Displacement and Stefan's Law

$$P = \sigma A T^4$$

$$P = 5.67 \times 10^{-8} \text{ W m}^{-2} \text{ K}^{-4} \times A \times T^4$$

$$P \propto \frac{1}{\lambda^5}$$

Classical wave theory
 The peak of the graph moves towards the shorter wavelengths as the temperature increases.
 Black body radiation curves for fixed bodies at 3000 K, 4000 K and 5000 K.

Planck's Interpretation of Light

- Max Planck suggested that the energy can only be released in discrete packets, or quanta - **Planck law**.
 - Discrete instead of the waves could be discrete packets, photon, but photon law E=hf, quanta-the interaction with an electron in a metal surface.

Figure 2: The classical wave theory prediction (blue line) tends to infinity in the ultraviolet region because it assumed that power is $\frac{1}{\lambda^5}$.
